Proposal #1

An application that when inputting a cooking ingredient such as ribeye steak or chicken breast will give the user popular recipes associated with that specific ingredient or a combination of ingredients. The user will also be able to view past recipes they accessed and favorite specific recipes for later viewing. The APIs used will mainly be an API that collects recipes and the other will probably be an extension of the ingredients or health information/facts.

Proposal #2

An application that utilizes image recognition API to analyze photographs of a user's feces. The app will assess various factors such as color, consistency, and shape and present this information to users. Data from user submissions will be stored in a database for analysis and future reference. It aims to assist individuals in monitoring their digestive health.
